The core function of a mill is to facilitate the transformation of raw inputs into usable outputs efficiently and consistently.

Historically, mills have been powered by water (watermills), wind (windmills), or manual labor. Modern mills primarily rely on electric power, enabling large-scale industrial processing. Their importance spans from traditional agricultural practices to complex manufacturing operations.

Types of MillsMills are classified based on their design, the material they process, and their specific function. The main types include:

- 1. Grain Mills**Grain mills are used to grind cereals such as wheat, corn, oats, and rye into flour or meal. They are fundamental in food production and come in various forms:
 - Stone Mills:** Use two circular stones to crush grains, traditional in many cultures.
 - Impact Mills:** Utilize high-speed rotors to pulverize grains into fine flour.
 - Hammer Mills:** Employ swinging hammers to crush grains, suitable for large-scale operations.
- 2. Tumbling Mills**Tumbling mills rotate around a horizontal axis, used primarily in mineral processing:
