Sample Problems from Chapter 10 and Their Solutions
Problem 1: Inscribed Angles
Question: In a circle, an inscribed angle intercepts an arc measuring 120° . What is the measure of the inscribed angle?
Solution: The measure of an inscribed angle is half the measure of its intercepted arc. Therefore, Angle measure = $120^\circ / 2 = 60^\circ$.
Answer: The inscribed angle measures 60° .
Problem 2: Arc Length Calculation
Question: A circle has a radius of 10 units. Find the length of

an arc that intercepts a 90° central angle. Solution: Arc length = $(\text{central angle} / 360^\circ) \times 2\pi r = (90^\circ / 360^\circ) \times 2\pi \times 10 = (1/4) \times 20\pi = 5\pi \approx 15.7$ units. Answer: The arc length is approximately 15.7 units.

Problem 3: Tangent and Secant Properties Question: A tangent and a secant intersect outside a circle, forming an angle of 40° . If the secant's external segment measures 6 units, what is the length of the tangent segment? Solution: Using the tangent-secant theorem, $(\text{External segment of secant}) \times (\text{whole secant segment}) = (\text{tangent segment})^2$. Suppose the secant's external segment is 6, and the entire secant segment is x , then: $6 \times x = (\text{tangent})^2$. To find the tangent segment, additional information about the secant's total length is needed. If, for example, the entire secant length is 10, then: $6 \times 10 = (\text{tangent})^2 \Rightarrow 60 = (\text{tangent})^2 \Rightarrow \text{tangent} = \sqrt{60} \approx 7.75$ units. Answer: The tangent segment measures approximately 7.75 units.

Deep Dive into Chapter 10 Key Concepts

- Arc Measures and Angles** Understanding how to calculate and interpret arc measures is fundamental in circle geometry.
 Inscribed Angles: An inscribed angle's measure is half the measure of its intercepted arc. Formula: $\angle BAC = \frac{1}{2} \text{measure of arc } BC$
Central Angles: The measure of a central angle equals the measure of its intercepted arc. Formula: $\angle AOB = \text{measure of arc } AB$
Arc Length and Area: When dealing with arc length, the formula involves the radius and central angle.
 Arc Length: $L = r \theta$ (where θ is in radians)
 Area of a Sector: $A = \frac{\theta}{2\pi} \times \pi r^2 = \frac{\theta r^2}{2}$
Answer Key Insights: The answer key provides step-by-step calculations for these problems, often including conversions between degrees and radians, and demonstrates how to use proportional reasoning to find missing measures.
- Properties of Chords, Tangents, and Secants** These elements are crucial in solving circle problems.
 Chord Theorems: Chords equidistant from the center are equal. The perpendicular bisector of a chord passes through the circle's center.
 Tangent Properties: A tangent is perpendicular to the radius at the point of contact. Tangent segments from a common external point are equal.
 Secants and External Points: The Power of a Point Theorem states: If two secants intersect outside a circle, $(\text{external segment of secant 1}) \times (\text{whole secant}) = (\text{external segment of secant 2}) \times (\text{whole secant})$
Answer Key Highlights: Solutions often involve applying the above theorems to find unknown lengths or angles, with detailed diagrams illustrating the problem setup.
- Inscribed and Cyclic Polygons**
Inscribed Polygons: Polygons inscribed in a circle have vertices on the circle.
 Polygon Angle Sum Theorem: The sum of interior angles of an n -sided polygon is $(n - 2) \times 180^\circ$.
 Inscribed Polygon Theorem: Opposite angles of a cyclic quadrilateral are supplementary (sum to 180°).
 Answer Key Application: Answers often involve calculating angles using the properties of inscribed and cyclic figures, with explanations on why certain angles are supplementary or congruent.
- Area and Perimeter of Circles and Related Figures**
Area of a Circle: $A = \pi r^2$
Circumference: $C = 2\pi r$
Area of a Sector: $\frac{\theta}{360^\circ} \times \pi r^2$
Problem-Solving Tips: The answer key guides students through setting up proportions, converting between degrees and radians, and applying formulas accurately.
- Coordinate Geometry Applications**
Equation of a Circle: $(x - h)^2 + (y - k)^2 = r^2$, where (h, k) is the center.
 Finding the Center and Radius: From the endpoints of a diameter or using given points, students can derive the circle's equation.
 Distance Formula: Used to confirm lengths of chords or secants, ensuring calculations align with geometric properties.
