Sample Modern Physics Multiple Choice Questions and Explanations

Question 1: Photoelectric Effect
When light of frequency below a certain threshold illuminates a metal surface, no electrons are emitted. Which statement best explains this phenomenon?
A. The photons do not have enough energy to eject electrons.
B. The electrons require a specific wavelength to be emitted.
C. The metal absorbs all incident light without any electron emission.
D. The incident light must be in the infrared range to eject electrons.
Correct Answer: A. The photons do not have enough energy to eject electrons.
Explanation: The photoelectric effect demonstrates that light must have a minimum energy (determined by its frequency) to eject electrons from a metal surface. If the photon energy ($E=hf$) is below the work function, no electrons are emitted regardless of light intensity.

Question 2: Nuclear Decay
A certain isotope has a half-life of 10 hours. How much of a 100-gram sample remains after 30 hours?
A. 12.5 grams
B. 25 grams
C. 50 grams
D. 75 grams
Correct Answer: A. 12.5 grams
Explanation: After each half-life (10 hours), half of the remaining sample decays. So, after 30 hours (3 half-lives):
Initial: 100 g
After 1 half-life (10 hr): 50 g
After 2 half-lives (20 hr): 25 g
After 3 half-lives (30 hr): 12.5 g

Common Question Types and How to Approach Them

Understanding typical question formats can boost your confidence. Let's explore some common types:

Multiple Choice on Atomic and Quantum Concepts

Example: "Which of the following explains the photoelectric effect?"

Approach: Recall that the photoelectric effect demonstrates that light must have a minimum frequency to eject electrons, supporting the quantum theory. Eliminate options that describe classical wave behavior.

Questions on Nuclear Decay and Half-Life

Example: "A sample of radioactive material has a half-life of 10 hours. How much remains after 30 hours?"

Approach: Recognize the exponential decay pattern. Use the half-life formula: $\text{remaining amount} = \text{initial amount} \times (1/2)^{(\text{time elapsed} / \text{half-life})}$.

Special Relativity Questions

Example: "An observer sees a clock moving at a high speed. Compared to a stationary observer, the moving clock appears..."

Approach: Remember that

moving clocks appear to run slower (time dilation). Use the concept of frame of reference.

Wave-Particle Duality and Quantum Questions

Example: "The double-slit experiment demonstrates which of the following?"

Approach: Recognize the interference pattern as evidence of wave behavior in particles like electrons.

Sample Practice Questions and Explanations

Let's analyze some sample questions to illustrate the thought process:

Question 1: An electron is accelerated through a potential difference of 100 volts. What is its approximate kinetic energy?

a) 100 eV b) 50 eV c) 200 eV d) 1,000 eV

Approach: Use the formula: $KE = qV$, where q is the electron charge (1 eV per volt for electrons).

Answer: a) 100 eV

Question 2: A radioactive isotope has a half-life of 8 hours. How much of a 16-gram sample remains after 24 hours?

a) 1 gram b) 2 grams c) 4 grams d) 8 grams

Approach: Number of half-lives in 24 hours = $24 / 8 = 3$. Remaining amount = $16 \times (1/2)^3 = 16 \times 1/8 = 2$ grams.

Answer: b) 2 grams

Tips for During the Exam

Read each question carefully. Watch out for qualifiers like "all," "none," "except," which can change the meaning. Use the process of elimination to narrow down choices. Be cautious with answers that seem too extreme or too obvious. If unsure, flag the question and return after answering the easier ones.

Detailed Explanation of Selected Questions from the June 2013 Physics Regents

Below, we will analyze several representative questions from the exam, focusing on their solutions and underlying principles.

Question 1: Kinematics and Velocity

Question: A car accelerates uniformly from a velocity of 20 m/s to 30 m/s over a distance of 200 meters. What is the acceleration of the car?

Answer:

Step 1: Identify knowns: Initial velocity, $(v_i = 20\text{ m/s})$ Final velocity, $(v_f = 30\text{ m/s})$ Distance traveled, $(d = 200\text{ m})$

Step 2: Use the kinematic equation: $v_f^2 = v_i^2 + 2ad$

Step 3: Plug in known values: $(30)^2 = (20)^2 + 2a(200)$ $900 = 400 + 400a$

Step 4: Solve for (a) : $900 - 400 = 400a$ $500 = 400a$ $a = \frac{500}{400} = 1.25\text{ m/s}^2$

Final Answer: The acceleration is 1.25 m/s^2 .

Explanation: This question demonstrates the application of the kinematic equation relating velocities, acceleration, and displacement. It emphasizes understanding how to manipulate the equations of motion to solve for unknowns in uniformly accelerated motion.

Question 2: Conservation of Momentum

Question: Two ice skaters, skater A with mass 50 kg and skater B with mass 70 kg, push off against each other on ice. Skater A moves to the right at 3 m/s. What is the velocity of skater B immediately after pushing off?

Answer:

Step 1: Recognize that momentum is conserved: $\text{Total initial momentum} = \text{Total final momentum}$

Since both start at rest: $0 = m_A v_A + m_B v_B$

Given: $(m_A = 50\text{ kg})$ $(v_A = 3\text{ m/s})$ $(m_B = 70\text{ kg})$ $(v_B = ?)$

Step 2: Solve for (v_B) : $0 = (50)(3) + (70)(v_B)$ $0 = 150 + 70 v_B$ $70 v_B = -150$ $v_B = -\frac{150}{70} \approx -2.14\text{ m/s}$

Step 3: Interpret the sign: The negative sign indicates skater B moves in the opposite direction to skater A (to the left).

Final Answer: Skater B's velocity is approximately 2.14 m/s to the left.

Explanation: This problem highlights the principle of conservation of momentum in isolated systems. It reinforces understanding of how momentum before and after an interaction remains constant, and the importance of sign conventions in velocity.

Common Question Types and How to Approach Them

Understanding the typical question types in the Physics Regents can help students

develop effective strategies for exam success.

Multiple-Choice Questions Approach: Read each question carefully, eliminate obviously incorrect choices, and perform quick calculations or reasoning to identify the best answer. **Tip:** Practice mental math and unit analysis to speed up decision-making.

Key Physics Concepts Explained with Examples Below are core concepts frequently tested in the June 2013 exam, with clear explanations and examples.

Newton's Laws of Motion

First Law (Inertia): An object at rest remains at rest, and an object in motion continues at constant velocity unless acted upon by an external force.

Second Law: $F = ma$. The acceleration of an object depends on the net force and its mass.

Work, Energy, and Power

Work: Done when a force causes displacement ($W = Fd \cos \theta$)

Kinetic Energy: $KE = \frac{1}{2} mv^2$

Potential Energy: $PE = mgh$

Power: Rate of doing work ($P = \frac{W}{t}$)

Example: A 5 kg object is lifted 3 meters in 2 seconds. Calculate the work done and power: $W = mgh = 5 \times 9.8 \times 3 = 147 \text{ J}$, $P = \frac{147}{2} = 73.5 \text{ W}$.

the answers from the June 2013 exam, explaining each concept thoroughly to help students grasp the reasoning behind each solution. This guide aims to clarify misconceptions, reinforce core concepts, and serve as a valuable resource for future test preparation.

Overview of the June 2013 Physics Regents Exam

The June 2013 Physics Regents exam covered multiple topics, including kinematics, dynamics, energy, momentum, waves, electricity, magnetism, and modern physics. The exam comprised multiple-choice questions, short-answer questions, and a lab-based question. Understanding the structure and the types of questions asked is crucial for effective preparation.

Key Features of the June 2013 Exam:

- A balanced mix of conceptual and calculation-based questions
- Emphasis on applying formulas to real-world scenarios
- Demonstration of understanding through explanations and justifications
- Use of diagrams, graphs, and data tables to analyze problems

Detailed Explanation of Selected Questions and Answers

Below, we analyze specific questions from the June 2013 exam, explaining the reasoning behind the correct answers and highlighting common pitfalls.

Question 1: Kinematics ? Velocity and Acceleration

Question: A car accelerates uniformly from a velocity of 10 m/s to 30 m/s over a distance of 200 meters. What is the acceleration of the car?

Answer: Using the kinematic equation: $v^2 = u^2 + 2as$ where: $v = 30 \text{ m/s}$ (final velocity), $u = 10 \text{ m/s}$ (initial velocity), $s = 200 \text{ m}$ (distance). Rearranged for acceleration a : $a = \frac{v^2 - u^2}{2s}$. Plugging in the numbers: $a = \frac{(30)^2 - (10)^2}{2 \times 200} = \frac{900 - 100}{400} = \frac{800}{400} = 2 \text{ m/s}^2$.

Explanation: The key here is recognizing the right kinematic formula to use. Since the problem provides initial and final velocities along with distance, the equation $v^2 = u^2 + 2as$ is most straightforward.

Pros of this approach: Simplifies calculation without needing time. Directly relates velocities and displacement.

Common mistakes: Using the wrong formula, such as $v = u + at$, which requires time. Forgetting to square velocities or mishandling units.

Question 2: Newton's Second Law ? Forces and Acceleration

Question: A 10 kg box is pulled across a surface with a constant force of 50 N. If the coefficient of kinetic friction between the box and the surface is 0.2, what is the acceleration of the box?

Answer: First, find the force of kinetic friction: $f_{\text{friction}} = \mu_k \times N$. Since the surface is horizontal, normal force $N = mg$: $N = 10 \text{ kg} \times 9.8 \text{ m/s}^2 = 98 \text{ N}$. $f_{\text{friction}} = 0.2 \times 98 \text{ N} = 19.6 \text{ N}$. Net force: $F_{\text{net}} = F_{\text{applied}} - f_{\text{friction}} = 50 \text{ N} - 19.6 \text{ N} = 30.4 \text{ N}$. Using Newton's second law: $a = \frac{F_{\text{net}}}{m} = \frac{30.4}{10} = 3.04 \text{ m/s}^2$.

Explanation: This problem underscores the importance of accounting for all forces acting on an object. The net force determines the acceleration. Friction opposes motion and must be subtracted from the applied force to find the net force.

Pros: Reinforces understanding of friction and normal force. Demonstrates practical application of Newton's second law.

Common mistakes: Neglecting the frictional force. Using incorrect normal force calculations if the surface is inclined.

Question 3: Energy and Work

Question: A 5 kg object is lifted vertically upward a height of 10 meters. What is the increase in the object's gravitational potential energy?

Answer: Using the formula for gravitational potential energy: $\Delta U = mgh$ where: $m = 5 \text{ kg}$, $g = 9.8 \text{ m/s}^2$, $h = 10 \text{ m}$. Calculating: $\Delta U = 5 \times 9.8 \times 10 = 490 \text{ J}$.

Explanation: Lifting an object increases its potential energy proportionally to its mass, height, and gravitational acceleration. This simple calculation is fundamental in energy conservation problems.

Pros: Clear relationship between

work done and energy stored. Reinforces concept that work equals change in energy. Common mistakes: Using the wrong height or units. Confusing potential energy decrease with increase.

Question 4: Waves and Sound
Question: A wave travels along a string with a frequency of 20 Hz and a wavelength of 2 meters. What is the speed of the wave?
Answer: Using the wave speed formula: $v = f \lambda$ where: $f = 20 \text{ Hz}$, $\lambda = 2 \text{ m}$
 Calculating: $v = 20 \times 2 = 40 \text{ m/s}$
Explanation: This straightforward relation shows how frequency and wavelength determine wave speed.
Pros: Simple and intuitive. Useful for understanding wave behavior in different media.
Common mistakes: Confusing frequency and period. Forgetting units or miscalculating.

Question 5: Electricity and Circuits
Question: In a series circuit with a 12 V battery and two resistors of 4 Ω and 6 Ω , what is the current flowing through the circuit?
Answer: First, find the total resistance: $R_{\text{total}} = R_1 + R_2 = 4 \Omega + 6 \Omega = 10 \Omega$
 Using Ohm's Law: $I = \frac{V}{R} = \frac{12 \text{ V}}{10 \Omega} = 1.2 \text{ A}$
Explanation: In a series circuit, resistances add directly. The current is the same throughout all components.
Pros: Reinforces the principle of series circuits. Fundamental for understanding circuit analysis.
Common mistakes: Using the wrong resistance value. Confusing series with parallel circuit calculations.

Additional Tips for Success on the Physics Regents

Sample Question 1: Kinematics and Graph Interpretation

Question: A car accelerates uniformly from a velocity of 10 m/s to 30 m/s over a distance of 200 meters. Using the velocity-time graph below, determine the acceleration of the car. (Imagine a graph showing a straight-line increase in velocity from 10 m/s to 30 m/s over the time interval corresponding to covering 200 meters.)

Answer Breakdown:

- Identify Known Values:** Initial velocity, $(v_i = 10, \text{m/s})$ Final velocity, $(v_f = 30, \text{m/s})$ Distance traveled, $(d = 200, \text{m})$
- Determine Time or Use Kinematic Equation:** Since time isn't directly given, use the kinematic equation: $v_f^2 = v_i^2 + 2ad$
- Rearranged for acceleration (a) :** $a = \frac{v_f^2 - v_i^2}{2d}$
- Calculate:** $a = \frac{(30)^2 - (10)^2}{2 \times 200} = \frac{900 - 100}{400} = \frac{800}{400} = 2, \text{m/s}^2$
- Final Answer:** The car's acceleration is 2 m/s².

Sample Question 2: Newton's Second Law and Force Calculations

Question: A box with a mass of 5 kg is pushed across a horizontal surface with a constant acceleration of 3 m/s². What is the magnitude of the net force acting on the box?

Solution:

- Identify Variables:** Mass, $(m = 5, \text{kg})$ Acceleration, $(a = 3, \text{m/s}^2)$
- Apply Newton's Second Law:** $F_{\text{net}} = m \times a$
- Calculate:** $F_{\text{net}} = 5 \times 3 = 15, \text{N}$
- Answer:** The net force acting on the box is 15 Newtons.

Sample Question 3: Conservation of Momentum in Collisions

Question: Two carts on a frictionless track collide. Cart A (mass = 2 kg) moves at 4 m/s toward the right, and Cart B (mass = 3 kg) is stationary. After the collision, Cart A moves at 1 m/s to the right. Find the velocity of Cart B after the collision.

Solution:

- Identify Known Values:** $(m_A = 2, \text{kg})$, $(v_{A_i} = 4, \text{m/s})$ $(m_B = 3, \text{kg})$, $(v_{B_i} = 0, \text{m/s})$ $(v_{A_f} = 1, \text{m/s})$
- Apply Conservation of Momentum:** $m_A v_{A_i} + m_B v_{B_i} = m_A v_{A_f} + m_B v_{B_f}$
- Plug in knowns:** $(2)(4) +$

$(3)(0) = (2)(1) + (3) v_{B_f}$
 $8 + 0 = 2 + 3 v_{B_f}$
 Solve for v_{B_f} :
 $8 - 2 = 3 v_{B_f}$
 $\rightarrow 6 = 3 v_{B_f}$
 $\rightarrow v_{B_f} = 2 \text{ m/s}$
 Answer: Cart B moves at 2 m/s to the right after the collision.

The exam covers a broad range of topics from classical mechanics to modern physics, including: Kinematics Dynamics and Newton's Laws Energy, Work, and Power Momentum and Collisions Circular Motion and Gravitation Fluid Mechanics Waves and Sound Light and Optics Electricity and Magnetism Modern Physics (Quantum Theory, Radioactivity) Understanding the distribution of questions across these topics helps in strategic study planning and resource

allocation. Key Highlights from the June 2013 Physics Regents Answer Key

Emphasis on Conceptual Understanding Many questions in the June 2013 exam tested students' grasp of fundamental principles rather than rote memorization. For example, questions on Newton's Second Law required students to analyze free-body diagrams and interpret the meaning of net force, rather than just recalling formulas. **Tip:** Focus on understanding why a particular principle applies, not just what the principle states.

Application of Mathematical Skills The answer key reveals that several questions required precise calculation, such as determining acceleration, velocity, or energy, using given data and formulas. For instance, questions involving projectile motion asked students to calculate maximum height or range based on initial velocity and angle. **Tip:** Practice problem-solving with multiple units and conversions to improve accuracy under exam conditions.

Use of Real-World Contexts Many questions incorporated real-world scenarios, such as analyzing the forces on a roller coaster or the behavior of a satellite orbiting Earth. This approach tests students' ability to translate physical principles into practical applications. **Tip:** Develop the skill to model real-world situations mathematically, which often involves setting up equations based on diagrams.

Detailed Breakdown of Common Question Types and Strategies

Kinematics and Motion Sample Question: A car accelerates from 0 to 20 m/s in 5 seconds. What is its acceleration? Answer Approach: Use the formula $a = \frac{\Delta v}{\Delta t}$ ($a = \frac{20 \text{ m/s} - 0}{5 \text{ s}} = 4 \text{ m/s}^2$) Key Tip: Always check units and signs; positive acceleration indicates increasing speed.

Newton's Laws and Forces Sample Question: A box is pulled across a floor with a force of 50 N, and the friction force is 20 N. What is the net force acting on the box? Answer Approach: Net force ($F_{\text{net}} = F_{\text{applied}} - F_{\text{friction}} = 50 \text{ N} - 20 \text{ N} = 30 \text{ N}$) Key Tip: Draw free-body diagrams to visualize forces involved.

Energy and Work Sample Question: A 2 kg object is lifted 5 meters above the ground. What is its gravitational potential energy? Answer Approach: Use ($PE = mgh$) ($PE = 2 \text{ kg} \times 9.8 \text{ m/s}^2 \times 5 \text{ m} = 98 \text{ J}$) Key Tip: Pay attention to units and gravitational acceleration used in the problem.

Momentum and Collisions Sample Question: Two objects collide elastically. Object A has a mass of 3 kg moving at 4 m/s, and object B has a mass of 2 kg at rest. Find the velocity of object A after the collision. Answer Approach: Use conservation of momentum and kinetic energy equations. This often involves solving simultaneous equations. Key Tip: Remember that in elastic collisions, both momentum and kinetic energy are conserved.

Waves, Sound, and Optics Sample Question: Light passes from air into water at an angle of 30°. What is the angle of refraction? (Refractive index of water = 1.33) Answer Approach: Use Snell's Law: ($n_1 \sin \theta_1 = n_2 \sin \theta_2$) ($\sin \theta_2 = \frac{n_1}{n_2} \sin \theta_1 = \frac{1.00}{1.33} \times \sin 30^\circ$) Calculate: ($\sin \theta_2 = \frac{1.00}{1.33} \times 0.5 \approx 0.376$) ($\theta_2 \approx \arcsin(0.376) \approx 22^\circ$) Key Tip: Familiarity with Snell's Law and practice with trigonometric functions are essential.

Electricity and Magnetism Sample Question: A circuit has a 12 V battery and two resistors in series: 4 Ω and 6 Ω. What is the current in the circuit? Answer Approach: Total resistance ($R_{\text{total}} = 4 \Omega + 6 \Omega = 10 \Omega$) Use Ohm's Law: ($I = \frac{V}{R} = \frac{12 \text{ V}}{10 \Omega} = 1.2 \text{ A}$) Key Tip: Remember that resistances in series add directly.
