

Cases in engineering economy solutions

Cases in engineering economy solutions play a crucial role in guiding engineers, project managers, and decision-makers toward making informed financial choices in engineering projects. These cases exemplify real-world scenarios where economic principles are applied to evaluate costs, benefits, risks, and alternatives to optimize resource allocation and maximize returns. Understanding these cases helps professionals develop a systematic approach to solving complex financial problems, ensuring project viability and sustainability. In this comprehensive article, we will explore various cases in engineering economy solutions, illustrating methods, strategies, and best practices used to evaluate and select the most economical options across different engineering sectors.

Introduction to Engineering Economy Cases

Engineering economy involves analyzing the costs and benefits associated with engineering projects to determine the most economical solution. Cases in this field often involve evaluating various alternatives, considering factors such as initial investment, operating costs, salvage value, and the time value of money. These cases serve as practical examples for applying theoretical concepts like present worth, future worth, annual worth, and rate of return.

Common Types of Engineering Economy Cases

Understanding typical cases helps in recognizing patterns and developing a structured approach to solving similar problems.

- 1. Replacement Decisions** Replacement cases involve deciding whether to replace an existing asset or continue operating it. Key considerations include:
 - Asset age and condition
 - Operating and maintenance costs
 - Salvage value
 - Cost of new equipment
 - Technological obsolescence
- 2. Equipment Selection and Investment Analysis** These cases focus on choosing the most economical equipment or investment option among multiple alternatives, considering factors like:
 - Initial costs
 - Operating costs
 - Efficiency
 - Longevity
 - Residual value
- 3. Cost Reduction and Process Improvement** Cases here aim to identify opportunities for reducing costs or improving processes without compromising quality or safety, often through:
 - Process redesign
 - Material substitution
 - Technological upgrades
- 4. Project Feasibility and Financial Analysis** Assessing whether a project is financially viable using techniques such as:
 - Net Present Value (NPV)
 - Internal Rate of Return (IRR)
 - Benefit-Cost Ratio (BCR)

Case Study 1: Equipment Replacement Decision

Scenario A manufacturing plant has a machine that is 8 years old. The machine's original cost was \$50,000, and it has a salvage value of \$5,000. The annual operating costs are currently \$4,000, and these costs are expected to increase by 3% annually. The machine's useful life is 15 years, and the new machine costs \$70,000 with estimated annual operating costs of \$2,500. The plant's minimum acceptable rate of return is 10%.

Solution Approach To determine whether to replace the machine now or continue operating it, we evaluate the total costs over the remaining useful life using present worth analysis.

Step 1: Calculate the present worth of continuing operation

- Operating costs for the remaining 7 years (since 8 years have passed)
- Salvage value at the end of 7 years

Step 2: Calculate the cost of replacement

- Initial cost of new machine
- Operating costs over the next 7 years
- Salvage value of the new machine at the end of 7 years

Step 3: Compare the total present worths

Calculations: Operating costs escalate at 3% annually. Use present worth formula for escalating costs:

$$PW = \text{Annual Cost} \times \frac{1 - (1 + g)^{-n}}{i - g}$$

where:

- g = growth rate (3%)
- i = discount rate (10%)
- n = number of

years For continuing operation: $PW_{\text{oper}} = 4000 \times \frac{1 - (1 + 0.03)^{-7}}{0.03}$ For the new machine: $PW_{\text{new}} = 70,000 + 2,500 \times \frac{1 - (1 + 0.03)^{-7}}{0.03} - \text{salvage value discounted}$ Decision: If the present worth of keeping the old machine exceeds that of replacing it, replacement is justified.

Case Study 2: Investment Analysis for a New Project

Scenario A company is considering investing in a new production line that costs \$200,000. The project is expected to generate additional annual net cash inflows of \$50,000 for 6 years. The company's required rate of return is 12%. The salvage value at the end of 6 years is estimated at \$20,000.

Solution Approach Use the Net Present Value (NPV) method to evaluate the project's viability.

Step 1: Calculate Present Worth of Cash Inflows $PW_{\text{inflows}} = \$50,000 \times \frac{1 - (1 + 0.12)^{-6}}{0.12}$

Step 2: Add salvage value discounted to present $PV_{\text{salvage}} = \$20,000 \times (1 + 0.12)^{-6}$

Step 3: Determine NPV $NPV = PW_{\text{inflows}} + PV_{\text{salvage}} - \text{initial investment}$

Decision: If $NPV > 0$, the investment is financially justified. If $NPV < 0$, the project should be rejected.

Case Study 3: Cost Reduction Through Process Optimization

Scenario An industrial process incurs annual costs of \$150,000. Management considers investing in new technology that costs \$300,000 but promises to reduce annual operating costs to \$100,000. The new equipment has a lifespan of 10 years with no salvage value, and the company's discount rate is 8%.

Solution Approach Calculate the payback period and analyze the cost savings through annual worth analysis.

Step 1: Calculate the annual savings $\Delta C = \$150,000 - \$100,000 = \$50,000$

Step 2: Determine the payback period $\text{Payback period} = \frac{\text{Initial investment}}{\text{Annual savings}} = \frac{\$300,000}{\$50,000} = 6 \text{ years}$

Step 3: Calculate the present worth of savings over 10 years $AW = \$50,000$ $PW_{\text{savings}} = AW \times \frac{1 - (1 + i)^{-n}}{i}$

Plugging in the numbers: $PW_{\text{savings}} = \$50,000 \times \frac{1 - (1 + 0.08)^{-10}}{0.08}$

Decision: If the present worth of savings exceeds the initial cost, the investment is economical. Otherwise, consider alternative options.

Best Practices in Analyzing Engineering Economy Cases

To effectively solve cases in engineering economy solutions, practitioners should adhere to several best practices:

1. **Clearly Define Objectives and Constraints** Understanding the project's goals and limitations ensures relevant analysis and accurate decision-making.
2. **Gather Accurate Data** Reliable data on costs, salvage values, inflation, and discount rates are essential for credible results.
3. **Use Appropriate Economic Evaluation Methods** Select methods like NPV, IRR, payback period, or benefit-cost ratio based on the context.
4. **Consider Multiple Alternatives** Always evaluate different options to identify the most economical solution.
5. **Incorporate Sensitivity Analysis** Assess how changes in key assumptions impact outcomes to understand risk and robustness.

Conclusion Cases in engineering economy solutions exemplify the practical application of financial principles to engineering decisions. From replacement analysis and investment evaluation to cost reduction strategies, these cases reinforce the importance of systematic analysis and sound judgment. By mastering various evaluation techniques and understanding real-world scenarios, engineers and decision-makers can optimize resource utilization, enhance project profitability, and ensure sustainable growth. Whether dealing with equipment replacement, project investments, or process improvements, applying the right economic tools and approaches is fundamental to achieving successful outcomes in engineering projects.

Engineering Economy Solutions: A Deep Dive into Practical Applications and Case Studies

In the world of engineering, decision-making is an integral aspect that can significantly influence project success, financial viability, and long-term sustainability. Engineering economy solutions serve as a systematic approach to evaluating the economic merits of different engineering projects, options, or investments. This article explores various cases and real-world applications of engineering economy solutions, providing insights into methodologies, decision criteria, and best practices that professionals employ to optimize outcomes.

Introduction to Engineering Economy Solutions

Engineering economy is a branch of economic analysis dedicated to comparing the costs and benefits associated with engineering projects over their life spans. The primary goal is to determine the most economical alternative that satisfies technical requirements while minimizing costs and maximizing benefits.

Key Components of Engineering Economy Solutions:

- Cost Analysis:** Identifying and quantifying all relevant costs (initial, recurring, and residual).
- Benefit Analysis:** Estimating the benefits derived from the project or alternative.
- Time Value of Money:** Applying concepts such as present worth, future worth, and annuities.
- Economic Metrics:** Calculating net present value (NPV), internal rate of return (IRR), payback period, and benefit-cost ratio.
- Decision Making:** Using comparative analysis to select the optimal alternative.

Case 1: Evaluating Alternative Power Generation Methods

Background A utility company seeks to determine whether to invest in a new coal-fired power plant or a solar photovoltaic (PV) installation. Both options have distinct initial costs, operational expenses, environmental impacts, and lifespan. The goal is to evaluate which alternative offers the best economic value over a 20-year period.

Approach The engineering economy solution involves:

- Estimating Initial Investment:** Capital costs for both options.
- Operational and Maintenance Costs:** Annual expenses over the project's lifespan.
- Salvage Value:** Residual value at the end of the period.
- Discount Rate:** Reflecting the company's cost of capital, assumed at 8%.

Analysis

Item	Coal Plant	Solar Plant
Initial Costs	\$500 million	\$300 million
Annual Operating Costs	\$50 million	\$10 million
Lifespan	20 years	20 years
Salvage Values	\$50 million	\$20 million

Methodology: Using the present worth analysis, the total costs or benefits are discounted to their present value for comparison.

Calculations:

Present Worth of Operating Costs (PWOC):

$$PWOC = \text{Annual Cost} \times \frac{1 - (1 + i)^{-n}}{i}$$

Present Worth of Salvage Value:

$$PWSV = \text{Salvage} \times (1 + i)^{-n}$$

Results:

Coal Plant:

$$PWOC = \$50 \text{ million} \times 11.33 = \$566.5 \text{ million}$$

$$PWSV = \$50 \text{ million} \times (1 + 0.08)^{-20} = \$50 \text{ million} \times 0.2145 = \$10.7 \text{ million}$$

$$\text{Total Present Worth} = \text{Initial Cost} + PWOC - PWSV = \$500\text{M} + \$566.5\text{M} - \$10.7\text{M} = \$1,055.8 \text{ million}$$

Solar Plant:

$$PWOC = \$10 \text{ million} \times 11.33 = \$113.3 \text{ million}$$

$$PWSV = \$20 \text{ million} \times 0.2145 = \$4.29 \text{ million}$$

$$\text{Total Present Worth} = \$300\text{M} + \$113.3\text{M} - \$4.29\text{M} = \$409 \text{ million}$$

Conclusion Based on present worth analysis, the solar photovoltaic installation offers a significantly lower total present value cost, making it the more economical choice over the 20-year span. However, other factors like environmental regulations and energy reliability should also be

considered. **Case 2: Life Cycle Cost Analysis of Industrial Equipment**
Background An industrial plant plans to install a new cooling system. The decision hinges not only on purchase cost but also on maintenance, energy consumption, and operational efficiency over the equipment's expected life.
Approach Applying Life Cycle Cost (LCC) analysis, engineers evaluate:
 Initial purchase price
 Operating costs (energy, maintenance)
 Replacement costs
 Residual or salvage value
Data Summary
Option A (Standard Cooling System):
 Purchase Price: \$100,000
 Annual Maintenance: \$5,000
 Energy Consumption: 50,000 kWh/year @ \$0.10/kWh
 Expected Life: 10 years
 Salvage Value: \$10,000
Option B (High-Efficiency System):
 Purchase Price: \$150,000
 Annual Maintenance: \$3,000
 Energy Consumption: 30,000 kWh/year @ \$0.10/kWh
 Expected Life: 10 years
 Salvage Value: \$15,000
Analysis
 Calculating the Present Worth of Total Cost for each option over 10 years, assuming an 8% discount rate.
Option A:
 Purchase Price: \$100,000
 Maintenance PV: $\left[\frac{5,000}{0.08} \left(1 - (1 + 0.08)^{-10} \right) \right] \approx 5,000 \times 6.71 \approx \$33,550$
 Energy Cost PV: $\left[50,000 \times 0.10 \times 6.71 \right] \approx 50,000 \times 0.10 \times 6.71 \approx \$33,550$
 Salvage Value PV: $\left[10,000 \times (1 + 0.08)^{-10} \right] \approx 10,000 \times 0.4632 \approx \$4,632$
 Total Present Worth Cost: $\left[100,000 + 33,550 + 33,550 - 4,632 \right] \approx \$162,468$
Option B:
 Purchase Price: \$150,000
 Maintenance PV: $\left[\frac{3,000}{0.08} \left(1 - (1 + 0.08)^{-10} \right) \right] \approx 3,000 \times 6.71 \approx \$20,130$
 Energy Cost PV: $\left[30,000 \times 0.10 \times 6.71 \right] \approx 30,000 \times 0.10 \times 6.71 \approx \$20,130$
 Salvage Value PV: $\left[15,000 \times (1 + 0.08)^{-10} \right] \approx 15,000 \times 0.4632 \approx \$6,948$
 Total Present Worth Cost: $\left[150,000 + 20,130 + 20,130 - 6,948 \right] \approx \$183,312$
Conclusion While the high-efficiency system has higher initial costs, the lower operating expenses lead to a marginally higher total present worth cost compared to the standard system. The final decision should also consider non-quantitative factors such as environmental impact and energy efficiency mandates.
Case 3: Cost-Benefit Analysis for Infrastructure Projects
Background A city is evaluating whether to upgrade its public transportation infrastructure with a new light rail system or enhance existing bus services. The decision involves assessing economic viability, social benefits, and environmental impacts.
Approach The engineering economy solution involves:
 Quantitative assessment of costs and benefits
 Assigning monetary values to intangible benefits like reduced congestion
 Calculating benefit-cost ratio (BCR)
Data Summary
Light Rail System:
 Capital Cost: \$2 billion
 Operating Cost per Year: \$50 million
 Expected Lifespan: 30 years
 Estimated Benefits (reduced congestion, time savings): \$150 million/year
Enhanced Bus Service:
 Capital Cost: \$200 million
 Operating Cost per Year: \$80 million
 Expected Benefits: \$80 million/year
Analysis
 Applying discounted cash flow analysis at 5%:
Light Rail:
 Present Worth of Benefits: $\left[150 \times \frac{1 - (1 + 0.05)^{-30}}{0.05} \right] \approx 150 \times 18.4 \approx \2.76 billion
 Present Worth of Costs: $\left[2,000 + 50 \times 18.4 \right] \approx 2,000 + 920 \approx \2.92 billion
 Benefit-Cost Ratio (BCR): $\left[\frac{2.76}{2.92} \right] \approx 0.95$
Enhanced Bus Service:
 Benefits PV: $\left[80 \times 18.4 \right] \approx \1.47 billion
 Costs PV: $\left[200 + 80 \times 18.4 \right] \approx 200 + 1,472 \approx \1.67 billion
 BCR: $\left[\frac{1.47}{1.67} \right] \approx 0.88$
